

Editorial Evidence System

Calm evidence journal

PR REVIEW EDITION / SYNTHETIC ONLY

Coastal Form & Flow Pty Ltd is fictional. Browser display state only, no real customer data, credentials, authentication, billing, provider access, messages, bookings, publication, restoration, deletion or external side effects.

CURRENT CHAPTER

Overview

Readiness, current measures, the next best synthetic action and recent activity.

CHAPTER 01 / DESK BRIEF

The evidence record, at a glance.

One quiet place to understand what AI surfaces report, which facts carry authority and what still requires a person.

WORKSPACE READINESS

4 OF 7 CHECKS COMPLETE

Identity, organisation, authority and first location are established for the synthetic fixture. Truth Sheet approval is the next gate.

VISIBILITY

62% → 74%

FACTUAL ACCURACY

87% → 92%

ENQUIRY PATH

54% → 68%

Synthetic demo state reset. No customer, provider, billing or production state changed.

PRIMARY SOURCE

Truth Sheet v3

REVIEW NOTE

Evidence can inform a decision. It does not make one.

REVIEW-ONLY JOURNAL. NO PRODUCTION AUTHORITY.

REVIEW STATE	IMMUTABLE BUILD	COST STATE
Complete 12-view front-end candidate	5ccbf0b / PR #1 open and unmerged	No paid service used

Choose Editorial if owner trust, evidence review and premium restraint should lead the experience, and founders accept a slower, more document-like interaction rhythm.

- Open immutable product workspace
- Open pull request #1

What was actually built

The selected visual direction can change later without rebuilding product semantics: both workspaces share one deterministic state engine while each owns a separate document structure and presentation system.

01	Semantic evidence journal	A dedicated 12-view HTML workspace with a masthead, horizontal contents, wide reading canvas and one visible chapter at a time.
02	Independent presentation	An Editorial-only stylesheet owns the ivory, ink and oxblood system, folio annotations, composed tables and calm stacked mobile sheets.
03	Shared state engine	The browser engine owns navigation, five-role capability gating, onboarding, diagnostic, Truth Sheet, action, connector, recovery, billing, outcome and audit state machines.
04	Safe local outputs	Suite-specific localStorage persists only synthetic display state. Blob downloads create fixed proof and audit JSON with an explicit non-production boundary.
05	Restrained interaction	Native controls and one reusable dialog provide consequence previews without importing Kinetic ticker, scan, pulse or signal-packet behavior.

Implementation inventory

Workspace HTML	608 lines / 52.8 KB	showcase/editorial-product.html
Suite CSS	40 authored rule groups / 36.3 KB	showcase/assets/editorial-product.css
Shared engine	1,523 lines / 72.6 KB	Navigation, persistence, permissions, workflows, receipts, exports and audit
QA harness	390 lines / 19.2 KB	Twelve end-to-end browser configurations

Suite-specific system

+	Publication-like masthead and horizontal chapter contents replace the command rail.
+	A persistent evidence folio shows chapter, source status and review note.
+	Serif display hierarchy, fine rules and composed tables prioritise trust and inspection.
+	Mobile becomes calm stacked sheets with a contained horizontally scrollable chapter strip.
+	No electric lime, angular console cuts, live ticker, telemetry pulse or signal spine is used.

One complete product journey

Every area below is a real navigable browser view with deterministic interactions, receipts and resettable state. Functional parity is deliberate; visual convergence is prohibited.

VIEW	PRODUCT AREA	WHAT THE REVIEWER CAN TEST
01	Overview	Readiness, current measures, next best action and recent activity.
02	Onboarding	Seven gates covering identity, authority, location, facts, manifest and baseline.
03	Diagnostic	Two deterministic synthetic runs with a gated scorecard release.
04	Truth Sheet	Canonical facts, source authority, freshness, conflicts and approval preview.
05	Scorecard	Surface evidence, priorities, methodology and release status.
06	Actions	Prepare, review and accept work for a demo queue without sending it.
07	Outcomes	Baseline, approved change, exposure and honest attribution evidence.
08	Connectors	Purpose-bound consent and active, degraded and revoked states.
09	Team	Five fixed roles, bounded invitation and protected ownership transfer.
10	Recovery	Checkpoint comparison, restore-as-new-head and pending deletion with Undo.
11	Billing	Proof and Action plan hypotheses plus entitlement lifecycle states.
12	Audit	Append-only synthetic interaction history and local JSON export.

The decision is not based on static mockups

15/15 LANDING QA Both design journeys and neutral launcher	12/12 PRODUCT QA Both workspaces, including compact mobile	4 + 2 VIEWPORTS Four target sizes plus reduced motion and fallback fonts	0 RUNTIME ERRORS No page, console, request or document-overflow failures
---	---	---	---

Exercised interaction paths

+	All 12 destinations, URL hashes and single-visible-view behavior.
+	Seven-step onboarding and deterministic diagnostic release.
+	Truth Sheet proposal and owner approval with no publication.
+	Prepare, review and accept-for-demo-queue action lifecycle with no external effect.
+	Connector degradation, revocation and re-consent; five-role capability restrictions.
+	Recovery comparison, restore-as-new-head, pending deletion and Undo.
+	Proof and audit JSON downloads, persistence, complete reset and native dialog Escape behavior.

Diagnostic / Truth Sheet / Governed Actions

What the polished prototype still cannot prove

These are decision-relevant limitations, not hidden defects. The front-end is ready for a design choice; production readiness is a separate stage.

Editorial Evidence System limitations

+	The journal metaphor can feel like a report rather than an operating application; primary actions are deliberately quiet and may be overlooked.
+	Generous whitespace improves calm and evidence comprehension but creates more vertical scrolling and shows fewer decisions above the fold.
+	The 12-chapter mobile contents bar requires horizontal swiping. The partial next tab supplies a continuation cue, but discoverability still needs user testing.
+	The persistent evidence folio reduces the main reading width on desktop; it should become collapsible if real records become much denser.
+	Serif headlines and muted secondary labels support the premium tone but need a manual contrast and ageing-user review beyond automation.
+	Consequential controls may need stronger affordances without turning the suite into a conventional dashboard.

Shared prototype limitations

+	This is a polished browser product candidate, not a production customer service.
+	Identity, tenancy, permissions and billing are simulated. Browser roles do not authenticate or authorise anyone.
+	State is stored only as resettable synthetic localStorage data; it is not a secure or shared system of record.
+	Diagnostic measurements, outcome values and organisation details are fixed fictional fixtures.
+	Provider latency, API errors, reconciliation delays, multi-user contention and offline recovery are not yet represented by live services.
+	The downloadable proof and audit files are local synthetic JSON, not signed or server-issued customer records.
+	Automated accessibility and responsive checks passed, but no moderated customer usability study or manual assistive-technology audit has occurred.

Choose once, then build the real service

The two concepts should be compared now. After selection, engineering should converge on one production front-end and one shared protected backend rather than carrying both designs indefinitely.

1	Founder decision session	Run the same five tasks in both suites. Score comprehension, confidence, action findability, evidence clarity and mobile comfort before selecting one visual direction.
2	Freeze one production interface	Keep the other suite as an archived reference. Do not merge their presentation systems or maintain two production frontends.
3	Protected free diagnostic	Add real authentication, organisation and location tenancy, owner authority, secure storage, Truth Sheet workflows, observation collection and controlled scorecard release.
4	ARA Proof	Add Stripe test mode, signed idempotent webhooks, the ARA entitlement ledger, paid history and baseline-to-outcome evidence before any live charge is enabled.
5	ARA Action	Add one human-reviewed customer handoff with permission rechecks, retries, reconciliation and outcome capture. Full ServiceM8 automation can wait.
6	Production operations	Complete privacy, terms, monitoring, incident handling, backups, deletion drills, access review and support ownership before admitting real customer data.

Decision test for founders

In each suite: find the next issue, inspect its source, propose a Truth Sheet change, restrict the role to Reviewer, recover a checkpoint and explain what would or would not happen externally. Pick the suite that needs the least explanation while still feeling like the ARA product you want to sell.

HARD BOUNDARY	No live authentication, provider access, customer storage, Stripe object, payment, message, booking, publication, restoration or deletion exists in this review artifact.
